

Fictional Retrieval Study

SYNTHETIC DEMO DOCUMENT. All methods, datasets and results below are fictional. Not a scientific publication.

Abstract

We illustrate evidence-aware paper retrieval using a fictional dataset named DemoQA. This document is for software testing only.

1 Introduction

Readers need to inspect the evidence behind paper summaries. Our demonstration preserves page numbers and retrieves text and ruled tables.

2 Methods

The proposed method uses section-aware chunking. The synthetic training set contains 120 examples. The baseline uses fixed character windows.

The evaluation metric is exact-match accuracy. Retrieval uses BM25 in this demo. No model was trained to produce these fictional results.

3 Experiments

The proposed method achieves an accuracy of 91.2% on DemoQA. The baseline accuracy is 82.4%. These values are invented fixtures, not evidence of real improvement.

Table 1. Fictional results on DemoQA.

Method	Accuracy	Latency
Baseline	82.4%	240 ms
Proposed	91.2%	310 ms

4 Limitations

The demo does not include scanned documents or visual reasoning. The retrieval baseline cannot match cross-language paraphrases reliably.

5 Conclusion

This fixture supports testing of page provenance, table preservation and retrieval behavior. Real paper evaluation is required before making quality claims.
